

problem solved by exact.py

Choose

$$u(x,y) = x(1-x)\sin(\pi y)$$

(observe $u|_{\partial\Omega} = 0$ by construction)

compute

$$f(x,y) = -\nabla^2 u$$

$$= -u_{xx} - u_{yy}$$

$$= -(-2)\sin(\pi y) - (x(1-x)(-\pi^2)\sin(\pi y))$$

$$= (2 + \pi^2 x(1-x))\sin(\pi y)$$
